Recycling infrastructure that JEPLAN propose

JEPLAN has been building and running the recycling infrastructure to create the sustainable world. In order to realize such a world, the recycling infrastructure should be easy for everyone to understand and participate in. Our recycling infrastructure can utilize “traffic line of daily activities” for “traffic line of sustainable activities”. Collection hub will be placed on our “traffic line of daily activities” like supermarkets, schools, hospitals, etc, which all the consumers use for the daily activities. This will directly play a role as “traffic line of sustainable activities”.

Current Recycle projects in traffic line of daily activities

With the collaboration of consumers, major retailers, manufactures and the Japanese government, we have already started textile recycling project (FUKU-FUKU project) and plastic products recycling project (PLA-PLUS project).

Message

“Do you know the movie scene showing that one man dumps the garbage into the energy tank and suddenly the car starts moving? Our great efforts are vested to realize the amazing moment in our real world. With your assistance, we look forward to creating the further “traffic line of sustainable activities”.”

Chief Executive Officer
IWAMOTO, Michihiko
